TrustPay Escrow

A Stablecoin Smart-Contract Escrow for Cross-Border Freelance Work

```
$ cat team.txt
```

Augusto de Hollanda Vieira Guerner · Eduardo Gwosdz De Lazari · João Pedro Schmidt
Cordeiro · Micael Angelo Sabadin Presotto

Two strangers. Two countries. Someone always has to go first.

International freelance payments fail on trust, settlement, and transparency — and existing fixes only relocate the trust problem.

- > Client pays first → work may never arrive.
- > Freelancer delivers first → payment may never come, or gets reversed.
- > Centralized platforms hold the money — but they only **relocate trust** to a private custodian users cannot audit.
- > The escrow exists. It is just **invisible and discretionary**.

Lock funds → deliver milestone → release payment.

- [1] **Lock funds.** Client deposits USDC/USDT into the escrow smart contract.
- [2] **Deliver milestone.** Freelancer verifies on-chain the funds are locked, then works. A deliverable hash goes on-chain.
- [3] **Release payment.** Client approves → contract releases that milestone automatically.

No private party can silently redirect the funds.

A database gives a record. A smart contract gives custody guarantees both parties can verify.

ALTERNATIVE // WHAT IT CANNOT GIVE YOU

- > **database** → no verifiable custody guarantee
- > **bank / card** → central custodian; chargeback risk
- > **platform** → private, discretionary ledger

5 properties we use: immutability · decentralization · digital signatures · programmable transfer · transparent state.

Does NOT verify identity · enforce legal judgments · evaluate work quality.

On-chain for trust. Off-chain for everything else.

- > **On-chain:** escrow state, locked funds, approvals, dispute verdicts.
- > **Off-chain:** profiles, files, messages, KYC. Only file *hashes* go on-chain.
- > Stack: Solidity (L2) · Next.js · NestJS · Postgres · IPFS · The Graph · viem.
- > The backend never decides where money goes. The contract does.
- > No new chain — deploys on existing infrastructure.

One factory, many escrows. Each milestone is a state machine.

- > **Factory** — supported-token allowlist, fee config, arbitrator registry.
- > **Escrow** — client, freelancer, token, milestones, balance, dispute status.
- > Strict access control: `msg.sender` + state check on every function.
- > State machine: Created → Funded → Submitted → Approved → Released.
- > Disputed funds cannot leave the contract without a verdict. Ever.

Live demo — the happy path, on testnet.

Two wallets, side by side: **Client** (1,000 mUSDC) and **Freelancer** (0 mUSDC).

- [1] Client creates a 3-milestone escrow.
- [2] Client deposits 300 mUSDC. **Locked on-chain.**
- [3] Freelancer submits milestone 1 with a deliverable hash.
- [4] Client approves → contract releases 100 mUSDC. Done.
- [5] Dispute path is in the contract — narrated, not clicked today.

The fee is a few lines in a contract that already exists.

- > **Transaction fee** — 0.5–1.5% per completed escrow, collected automatically in stablecoin at release.
- > **Business subscription** — team accounts, advanced reporting, priority support.
- > **Dispute resolution fees** — shared with arbitrators to align incentives.
- > Customers: international freelancers, startups hiring globally, small agencies.

The platform is a facilitator, not a custodian.

Each phase depends on the verified success of the previous one.

- [1] **Proof of concept** — testnet + minimal UI + happy path. (today)
- [2] MVP / pilot — real L2, real stablecoins, indexer, managed disputes.
- [3] Business tier — team accounts, fiat ramps.
- [4] Hybrid arbitration (Kleros-style).
- [5] Multi-chain scale.

Blockchain exactly where it adds value — and nowhere else.

- > Honest limits: regulation varies · de-peg risk · subjective quality needs humans · onboarding friction · contract bugs possible.
- > Buildable today: audited tokens, existing L2s, mature wallets. **No new chain. No speculative technology.**

> *“A stablecoin smart-contract escrow can reduce the trust and settlement problems of cross-border freelance work by locking funds transparently and releasing them through programmable milestone rules.”*

Thank you.
