This event, held at the Federal University of Santa Catarina (UFSC) and organized by Blockchain Rio, delivered a comprehensive exploration of Brazil's evolving financial infrastructure, academic blockchain research, and global career opportunities in the Web3 ecosystem. Jean Martina argued that while PIX is a landmark achievement, a programmable Real stablecoin is the essential next step for Brazil's financial sovereignty. Lucas Palma showcased

LabSec's decade-long blockchain research portfolio spanning non-financial applications. A diverse industry panel then shared personal journeys and market insights, collectively affirming that the blockchain revolution is irreversible and that the demand for talent across all disciplines far exceeds current supply.

---

## The Case for a Programmable Real

---

Jean Martina opened with a deliberately provocative question: **does Brazil actually need a stablecoin, given that PIX already exists?** The framing set the stage for a nuanced argument that these two technologies are not rivals but occupy fundamentally different layers of a financial stack.

### PIX: A Cultural Revolution, Not Just a Technology

Jean began by establishing the undeniable scale of PIX's success. By the numbers: **over 170 million people** have made at least one PIX transaction, **more than 20 million companies** operate with it, and the system moves **35 trillion Brazilian Reals per year**. Technologically, he described PIX as conceptually similar to a traditional TED transfer — just executed in real time, with analogous message structures. Its true power, however, is socio-technical: PIX fundamentally changed Brazilian culture by making digital money the default. The combination of an **extremely low-friction interface** and **zero cost for individuals** (though not zero cost for the Central Bank or for businesses, which do face operational costs, albeit far lower than credit card acquiring fees) drove mass adoption to the point where millions of Brazilians no longer carry physical cash.

Jean contextualized PIX within a broader arc of Brazilian financial revolutions: the emergence of **credit cooperatives in the 1990s**, the rise of **fintechs like Nubank and Inter around 2010** (which built bank-like products outside traditional banking regulation), and now a **third financial revolution** centered on on-chain infrastructure — one that moves beyond both banks and fintechs entirely.

### Where PIX Falls Short: The Programmability Gap

Despite its success, PIX has a critical limitation: it moves **balances**, not **logic**. Its scope is explicitly defined as moving funds between regulated financial accounts within Brazil, primarily for daily payments. It operates on a **domestic liquidation model**, requiring institutions to register with the Central Bank. Furthermore, while PIX technically functions 24/7/365, Jean clarified that the actual **registration of transactions only occurs on banking days** — a meaningful distinction from truly continuous settlement. He also raised a long-term sustainability concern: the

Central Bank president acknowledged at Blockchain Rio the previous August that PIX costs the Central Bank a **fortune** to maintain, and there are credible concerns that public budgets may eventually force a reduction in transaction speed tolerances.

Jean also made a point often overlooked: most countries in the world — including Costa Rica, Colombia, and Argentina — already have payment rails equivalent to PIX. Instant payment infrastructure is becoming a global standard, not a competitive differentiator.

## **Stablecoins: Money That Thinks**

The core distinction Jean drew is that a **stablecoin** — a cryptocurrency maintaining a one-to-one parity with a fiat currency — can do something PIX cannot: it can carry **embedded logic**. This is the concept of **programmable money**. When a payment arrives in a stablecoin, the money itself can be pre-programmed to automatically split into investments: for example, allocating a portion to a CDB, another portion to crypto, and the remainder to savings — all executed autonomously via smart contracts, potentially governed by AI agents.

Stablecoins also operate **24/7/365 in a global, permissionless environment**, enabling their use as digital assets anywhere in the world, not just within Brazil's regulatory perimeter. This opens the door to market operations, investments, tokenization of receivables and physical assets, and entirely new financial paradigms.

## **Global Stablecoin Landscape and the Brazilian Opportunity**

Jean surveyed four distinct global use cases that illustrate stablecoins' real-world utility:

- **Argentina:** The world's leading stablecoin adopter, driven by severe exchange restrictions and chronic inflation — stablecoins serve as a shield against currency devaluation.
- **Nigeria:** Uses stablecoins to circumvent government exchange controls and maintain a functioning parallel exchange rate.
- **Turkey:** Heavily relies on stablecoins for **remittances**, allowing workers across Europe to send money to families back home efficiently.
- **Singapore:** Employs stablecoins in an institutionalized model to **fractionalize public bonds and government-controlled titles**.

The global stablecoin market is experiencing explosive growth, with **80% of all emissions denominated in US dollars** (dominated by USDT from Tether and USDC from Circle). However, a crucial and often overlooked trend is that **local-currency**

**stablecoin growth is running three times faster** than dollar stablecoin growth — a clear signal of maturing market demand for non-dollar programmable money.

For Brazil, a watershed moment came when the Central Bank president announced at the previous year's Blockchain Rio event that the **Drex digital Real project would be discontinued as a currency**, having faced architectural limitations. This decision created a significant market vacuum, which a wave of private stablecoin initiatives is now rushing to fill. Jean noted that Brazil's regulatory environment is actively supportive of this transition, with the Central Bank designing a **tiered licensing framework** that will accommodate players of varying sizes. Major Brazilian banks and financial institutions are already placing bets on stablecoin initiatives, recognizing them as the next foundational financial rail.

## The Value Proposition of Local Stablecoins

Jean argued forcefully that **digital and economic sovereignty** demand a local stablecoin. No scalable national financial system can be built on foreign currency — dollarization may solve short-term problems but ultimately places a nation's monetary policy under foreign tutelage. More practically: Brazilians live, earn, and spend in Reais. A vendor at a street fair does not accept dollars. If a holder of dollar-pegged stablecoins faces a 5% currency movement on a given day, they can lose an entire year's worth of investment yield in hours.

The key use cases Jean identified for a Real stablecoin in Brazil include:

- **Savings and Yield:** Generating returns from idle money that can exceed traditional instruments, programmatically and automatically.
- **Efficient FX:** Executing currency exchange directly via smart contracts, without intermediary applications or accounts.
- **Native Tokenization:** Converting any asset with assigned value — real estate, livestock, receivables — into fractionalized, Real-denominated digital tokens transferable anywhere.
- **24/7 Treasury Management:** Perpetually optimizing the balance between invested capital and available liquidity.
- **On-chain Neo-banks:** A new generation of banking applications that look and feel like Nubank but run entirely on-chain, converting deposits into digital Real and sourcing balances from the blockchain.

## Nora Finance and the Float-Based Business Model

Jean introduced **Nora Finance**, a stablecoin co-founded by students and professors (including himself) at the university. Nora Finance's core product is the **BRS** — a programmable Real designed to operate across multiple blockchain networks with a mint-and-burn mechanism. Its regulatory compliance layer sits within the

execution structure, with an ambition to evolve toward a **100% DeFi model with on-chain liquidity**.

The strategic thesis behind Nora Finance directly challenges the prevailing stablecoin business model. Today, most stablecoins are effectively worth less than face value once transaction fees are accounted for — a spread of roughly 5 cents in and 5 cents out means 1 Real effectively becomes 90 centavos. Nora Finance's counter-thesis is elegantly simple: **generate revenue from the float's treasury rather than from fees**. If 100 million BRS are in circulation and those funds are invested in Tesouro Direto at Brazil's Selic rate of approximately 15% annually, the treasury earns 15 million Reais per year — sufficient to operate the business without charging any transaction fees. Going further, a portion of that return can be **distributed as yield to BRS holders**, creating a stablecoin that not only transacts at par (1 BRS = 1 BRL, always) but also **pays interest to its holders**. Jean's conviction is that a frictionless, zero-fee, interest-paying open rail will naturally win the market precisely because it is permissionless and non-proprietary.

### **PIX and Stablecoins: A Stack, Not a Competition**

Jean concluded this section by reframing the entire discussion. PIX is not a competitor to stablecoins. They inhabit different layers of the same financial stack. PIX serves as the **on-ramp and off-ramp** between the traditional financial system and the on-chain world. A grandmother making a PIX payment feeds into a Real Digital layer, which can then tokenize an asset — making her an indirect participant in the on-chain economy without ever knowing it. The future is a layered architecture: PIX handles fiat-to-digital conversion; programmable Real carries embedded logic; and tokenized assets sit at the apex, enabling innovation not yet conceived. As Jean put it: "PIX makes money circulate better. Stablecoins make money function as software. The possibilities are infinite."

---

## **Blockchain Research and Non-Financial Applications**

---

Lucas Palma offered a panoramic view of blockchain's academic frontier, demonstrating that the technology's relevance extends well beyond financial markets. His presentation served as both an institutional record and an invitation to students seeking research paths in computing and systems.

### **LabSec: Two Decades of Security Research**

The **Laboratory of Security and Computing (LabSec)** at UFSC has operated for more than two decades, founded in 2001 within the Department of Informatics and Statistics. Its core specialties span digital certification, public key infrastructure

(PKI), digital signatures, electronic documents, cryptographic protocols, and ceremonies — with blockchain and, more recently, **verifiable credentials** added to its research portfolio.

As of 2026, the laboratory comprises **four associated professors** (three from the Florianópolis campus in computer science, one from the Aranguá campus in computer engineering), **one post-doctoral student**, **three CLT employees**, **more than 10 administrative education technicians (TAIs)** who are UFSC civil servants, **over 20 postgraduate students** (master's and doctoral), and **more than 30 undergraduate students** actively engaged in project development.

## The Blockchain Working Group: From 2017 to Today

Blockchain became a structured, collaborative pursuit within LabSec in **2017**, when Lucas Palma, Professor Jean Martina, and Professor Martim Vigil (Aranguá campus) formed a dedicated working group. The timing was notable: 2017 marked the first significant deflation of the blockchain hype cycle following the post-Ethereum growth surge, a period Lucas characterized as clarifying — separating genuine technological potential from inflated expectations. Today, blockchain has entered what Lucas described as a **stabilization phase**, where its real-world direction is clearer and the technology is maturing into reliable infrastructure.

The academic output of this working group is substantial:

- **Over 20 undergraduate TCC theses** in blockchain across computer science and information systems.
- **Seven master's theses** in total: five already defended, two currently in progress (Arthur Kripa and Lucas Costa).
- **Three doctoral theses**: one defended in 2024 (Lucas Palma's own work), with two others in active development by Johan Vesco and Gabriel Estevam.

Representative completed master's theses include Luca Camperi's *"Protocolo de Diploma Digital Autosoberano com Rastreabilidade Tecnológica"* and a work titled *"Blockchain Privacy and Scalability in the Decentralized Validity Energy Trading Context with Hyperledger Fabric"*. All works are publicly accessible through the UFSC institutional repository and the UFSC TCC website.

## Project Spotlight 1: Timestamping on Blockchain (2019–2020)

The first highlighted project, **"Tempestividade em Blockchain"** (Timeliness in Blockchain), was financed by **Brai Tecnologia**, a Florianópolis-based company. The research question was deceptively precise: given that different blockchain platforms generate blocks at varying intervals (Bitcoin in minutes, Ethereum in seconds), how accurately can a blockchain serve as a **trusted timestamping authority**?

The team proposed a model in which a document's cryptographic hash is broadcast to the network, and participating nodes use a form of decentralized voting to determine the precise moment the document first appeared — averaging out detection timestamps to cancel individual node errors. The result was a working prototype delivered to Brai Tecnologia that produced timestamps with **accuracy comparable to classical timestamping infrastructure**, even on networks with relatively large block generation windows. The project demonstrated that blockchain-based timestamping is not merely theoretically viable but practically achievable.

### **Project Spotlight 2: Post-Quantum Cryptography and ZKP for Blockchain (2019–2020)**

The second project, conducted in partnership with **Arison** — a company then developing a new blockchain platform — took a forward-looking stance on cryptographic resilience. LabSec delivered **protocols for converting classical cryptographic algorithms to post-quantum alternatives**, designed to protect blockchain systems against attacks that quantum computers will eventually be capable of executing. At the time, quantum computing was a more distant concern; today, it is an increasingly proximate reality. The project simultaneously investigated the application of **zero-knowledge proofs (ZKP)** within blockchain contexts — a technology that has since moved from academic curiosity to production-grade deployment across multiple Layer 2 networks. Lucas emphasized that both post-quantum resilience and ZKP will become progressively more critical as the blockchain ecosystem matures.

### **Project Spotlight 3: Higher Education Data Traceability Network (2022–Present)**

The most extensive and ongoing project is the **“Rede Rastreabilidade Dados da Educação Superior”** (Higher Education Data Traceability Network), financed by Brazil's **Ministry of Education** and running since late 2022. The project addresses a structural gap in Brazil's higher education governance: the Ministry currently bases most of its decisions on **bi-annual census data**, meaning it perpetually operates with information that is years old.

The proposed solution is a distributed, decentralized **data bus** through which higher education institutions can share data with each other and with the Ministry in **real time**. While the presence of a central regulator (the Ministry) might seem to contradict decentralization principles, Lucas explained that Brazil's higher education system is in fact **partially decentralized** by design — institutions retain significant administrative autonomy, including over data custody and sharing. The blockchain layer enables sharing without ceding that autonomy.

The network is built on **Hyperledger Fabric**, a framework from the Linux Foundation Decentralized Trust ecosystem. Hyperledger Fabric was chosen specifically for its ability to create **segmented data channels** — supporting both a public view accessible to all participants and private sub-networks isolating sensitive data — a critical requirement for compliance with Brazil's **Lei Geral de Proteção de Dados (LGPD)**. A key practical benefit of the system is its capacity to **detect and reduce fraud** in the issuance of academic documents, including diplomas and academic transcripts.

Lucas described the project as a daily exercise in navigating genuinely conflicting requirements: leveraging blockchain's transparency and immutability while simultaneously enforcing the data privacy mandates that modern regulation demands. This tension, he suggested, is precisely what makes the research intellectually valuable and professionally relevant.

---

## Panel Discussion: Opportunities in the Web3 Ecosystem

---

Moderated by Francisco Carvalho (Blockchain Rio), the panel brought together five professionals whose paths into the blockchain industry were as diverse as the roles they now occupy — a powerful testament to the breadth of opportunity the ecosystem offers.

### Panelist Introductions

**Solange Parisotto** is an economist with over 15 years in financial services, currently working at **Sicredi**, a credit cooperative. Cooperatives, she noted, differ structurally from traditional banks — members are co-owners, creating a distinct trust dynamic that enables innovation. Solange participated in **Phase 2 of the Drex pilot** and will be involved in the forthcoming Phase 3, which will focus heavily on credit. Her expertise lies in translating technology capabilities into real-world business value.

**Hamilton Haskell**, co-founder and CMO of **Chainless**, encountered Bitcoin in late 2013 — among the earliest adopters in his social circle. He entered university in 2015 to study physics, where he was famously “the only person talking about Bitcoin.” That single listener became his business partner, and together they have been building in crypto since 2018, through two failed ventures to their current one. Chainless is an **on-chain neo-bank** that uses PIX as the on-ramp, converts deposits into stablecoins, and leverages **account abstraction** (a mechanism championed by Ethereum's Vitalik Buterin) to make DeFi interactions dramatically simpler. As of the event, Chainless had reached **31,000 wallets created** and processed **over \$10 million in volume in February alone**.

**Bianca Gonzaga**, Head of Events and Communities at **Binance** for Brazil and parts of Latin America, is also a UFSC administration student in her final semester with a background in IT management. She entered Binance knowing little about blockchain, having been attracted by the opportunity itself. Her prior experience — internships at creative boutiques and Red Bull, participation in startup competitions, and leading athletic associations — gave her the event management and sales skills that secured her role. She now leads community and event initiatives for the **world's largest crypto exchange by volume**, serving over 300,000 users.

**Kais Al-Tabbaa** (referred to as “Caio” by the moderator), Country Manager of **Elibank**, brought perhaps the most viscerally personal story. A Syrian national who fled his country after two years of living through war, he arrived in Brazil as a refugee with nothing, working simultaneously in restaurants and language services to save money. When he encountered difficulties sending that money home — losing approximately 30% to banking intermediaries and fees — and subsequently discovered Bitcoin's white paper in 2017, it was not an investment thesis but a **solution to a real, urgent personal problem**. That insight drove him to immerse himself in the ecosystem, moving from trading and community engagement to business development roles at Neologica (a trading software company) and then Bitgate, where he grew the Latin American trading volume from **\$10 million to \$2 billion**. He has since launched his own company facilitating international fiat-to-crypto transactions and joined Elibank as Country Manager.

### **Market Opportunity: Scale and Urgency**

Francisco framed the market context: the global Web3 market is growing at **over 400% annually**. Every major Brazilian bank has active stablecoin or tokenization initiatives. The full chain of infrastructure — blockchains, custodians, exchanges, analytics firms — is expanding rapidly, as are the Web2 companies that must adapt or be displaced. For professionals with the right training, this translates to a **genuinely global labor market**, with compensation in dollars or euros accessible from anywhere.

Solange reinforced the scale with concrete figures: the tokenization market launched in 2020 at roughly **0.5% of global GDP potential**, currently sits between **3.5% and 5%** depending on the country, and is projected to reach **10% of global GDP by 2030** — representing approximately **\$16 trillion**. Of that figure, **50% of the opportunity resides in financial markets** (the fastest and most tractable sector), while **real-world assets like real estate account for 20%** (larger potential, but more complex due to the number of stakeholders involved). Former Central Bank president Campos Neto articulated the ultimate vision: a world where **everything is tokenized and interconnected on a single network**, enabling frictionless

transactions between any actors. Solange was unambiguous: “Whoever does not transform their business will become obsolete.”

A striking data point underscored the revolution already underway in Brazil: **10 million CPF holders** (Brazilian tax identification numbers) declare having some type of digital asset — **more than double the 5 million** who declare operating on Brazil’s stock exchange (B3). This crossover has already happened, quietly.

## Real-World Problem-Solving as the Core Discipline

Multiple panelists converged on a single principle: the entry point to value creation is identifying a **genuine real-world pain point**, then applying technology as the solution — not the reverse. Solange illustrated this with a compelling case study from Paraná: a farmer’s animal was **tokenized as collateral** for a bank loan, dramatically reducing the borrower’s interest rate. Delivering on this required not just blockchain for the token, but also a startup with an **IoT-enabled smart bracelet** that monitored the animal’s temperature in real time, continuously verifying that the collateral remained healthy and had not been sold. The lesson: meaningful solutions require combining **AI, IoT, and blockchain** into a coherent system oriented around user value — lower cost and faster delivery.

Francisco extended this to real estate transactions, describing how **atomic smart contracts** can resolve the classic escrow problem — ensuring that money and property title transfer simultaneously, with neither party at risk of delivering first. Hamilton introduced a specific cross-border use case: a Paraguayan logistics company was waiting two business days to convert incoming PIX payments into dollars. Chainless and its API platform Notos architected a system where incoming PIX payments are converted to Real stablecoins in real time, and the recipient can immediately swap into any other desired asset via liquidity pools — ending the wait entirely. Hamilton articulated a broader vision: just as dollar stablecoins matured to the point where any asset denominated in dollars could be transacted seamlessly, the same maturation is occurring for the Real, and ultimately for any tokenizable asset. His long-term belief is that blockchain is evolving toward a system where any party can pay in whatever they consider valuable and the recipient can receive in whatever they consider valuable — a digital evolution of barter, but with instant, programmable settlement.

## Roles, Pathways, and Skills in Demand

The panelists were emphatic that blockchain is not exclusively a developer’s domain. The ecosystem needs legal professionals to draft smart contract frameworks and navigate evolving securities regulation; compliance and custody specialists; financial analysts designing new tokenization products; community managers and marketers; business development professionals who can bridge

technical and commercial worlds; and support staff. Kais distilled it: “You only need to translate your talent and identify where it connects with this market.”

Francisco cited perhaps the most striking supply-demand imbalance in the industry: there are an estimated **only 16,000 blockchain developers globally** — against a demand that is scaling across every industry sector. A senior full-stack developer with blockchain expertise and English proficiency can command a minimum of **\$10,000 per month** and receives daily inbound job offers. For students of computer science and information systems in particular, the opportunity is immediate and concrete.

Bianca encouraged students not to underestimate the value of non-technical pathways. She outlined several structured entry points through Binance: the **Binance Academy** offers free courses with certificates from global universities. The **Binance Angels Program** enables volunteers to support the community, speak at events, and build public profiles — with top performers invited to the **Binance Blockchain Week in Dubai**. The “**Earn and Learn**” program rewards users with crypto for completing Academy lessons. Binance also participates in acceleration programs analogous to trainee programs, offering fully remote 8-hour-workday positions on a global team. CZ’s incubator, **Easy Labs**, maintains an open application form, as does the **BNB Chain**, which accepts project proposals directly.

Hamilton offered a personal note of candor: he left his physics degree when early crypto earnings exceeded a professor’s annual salary — and paid dearly for that decision. His advice was unequivocal: **do not drop out**. His recommended reading, *Dynamics of Wealth*, is designed to help individuals understand their personal archetype (negotiator, creator, system-builder, etc.) before choosing a professional path — because self-knowledge is the foundation of effective career positioning.

Francisco highlighted a funding mechanism often unknown to students: blockchain foundations such as **Ethereum, Stellar, and Cardano** operate **grants programs** — funding in tokens, essentially non-dilutive capital — for projects and startups building on their ecosystems. For anyone with an idea and a development plan, these grants represent a meaningful alternative to traditional venture funding.

---

## Concluding Remarks and Community Engagement

---

Francisco Carvalho closed the formal program with a framing that transcended the event itself. He drew an analogy to a 1998 conference he attended on the **TCP/IP protocol** — an event attended by technical specialists, discussing infrastructure that would ultimately underpin the entire internet, and that no one would ever explicitly discuss again because it became invisible infrastructure. His prediction: blockchain will follow the same trajectory. Today, Brazilian national identity is already issued on

blockchain. In a decade, “blockchain” will not be a conversation topic because it will simply be the substrate of everything — and **the people in that room are positioned to build the products and companies that will make that transition happen.**

Francisco emphasized that this moment represents “the greatest opportunity of this generation” — comparable in scale to the early internet, but now combined with AI, IoT, RFID, and other converging technologies. Unlike the internet era, however, this generation has the advantage of seeing it coming clearly enough to prepare deliberately.

Several practical mechanisms for continued engagement were announced. A **QR code** displayed during the event serves as a unified access point: attendees can use it to obtain their **participation certificate**, register for event tracking, and receive a **free ticket** to the main Blockchain Rio event once ticketing opens. The code also connects participants to the Blockchain Rio community infrastructure.

Blockchain Rio conducts an **annual online Hackathon** — now in its fifth year — with global company partners involved in prizes. The format is explicitly **introductory and multidisciplinary**: teams are not required to be composed of developers, and participants learn from the ground up. Previous editions produced companies that went on to receive investment. The current university tour — having started in Curitiba at Fibes and visiting UFSC that day — will continue to the **Federal University of Rio Grande do Sul (Porto Alegre), Unicinos, and UFIS in Vitória**, with the full tour accessible via Blockchain Rio’s social media channels.

Francisco recommended Fernando Ulrich’s 2015 book *“Bitcoin: A Moeda na Era Digital”* (available as a free audiobook on YouTube) as foundational reading for anyone seeking to understand Bitcoin’s theoretical architecture and, by extension, blockchain at its core. Solange reinforced the closing message with characteristic directness: “This revolution has no reverse gear. It has started and will only grow.” She urged attendees to engage actively — seek out people already in the market, ask questions, and form opinions through dialogue rather than passivity.

---

## Action Items

---

### @Event Attendees (General)

- [ ] Scan the QR code displayed at the event to obtain a participation certificate and register to receive a free ticket for the main Blockchain Rio event - [TBD]
- [ ] Connect with Francisco Carvalho on LinkedIn and follow Blockchain Rio on Instagram and LinkedIn (@BlockchainRio / @BlogTeamRio) - [TBD]

- [ ] Read “*Bitcoin: A Moeda na Era Digital*” by Fernando Ulrich (free audiobook available on YouTube) to understand Bitcoin’s theoretical architecture and its implications for blockchain broadly - [TBD]
- [ ] Explore Blockchain Rio’s YouTube channel for recorded talks, including tokenization sessions and Central Bank presidential addresses - [TBD]
- [ ] Register for and participate in the annual online Blockchain Rio Hackathon (multidisciplinary, introductory format; held with global company partners) - [TBD]
- [ ] Follow Blockchain Rio on social media (@[blockchainrio.com.br](https://blockchainrio.com.br)) for updates on job vacancies, market opportunities, and event announcements - [TBD]
- [ ] If planning to create a startup or build a project on blockchain, research and apply for **grants programs** from blockchain foundations such as Ethereum, Stellar, and Cardano - [TBD]
- [ ] Engage with people already active in the market — connect with speakers on LinkedIn and initiate conversations - [TBD]
- [ ] Network with other attendees and speakers to explore complementary competencies - [TBD]

#### @UFSC Students (Computer Science / Information Systems)

- [ ] Visit LabSec on the second floor of the Department of Informatics and Statistics to inquire about blockchain TCC thesis topics and research project participation - [TBD]
- [ ] Browse the UFSC TCC repository and institutional repository to review existing blockchain theses for background research - [TBD]

#### @Students & Career Seekers (General)

- [ ] Explore Binance Academy for free blockchain and crypto courses with global university certifications — including the “Earn and Learn” program that rewards study with crypto - [TBD]
- [ ] Investigate the **Binance Angels Program** for volunteering opportunities that build public profile and community engagement experience - [TBD]
- [ ] Follow Bianca Gonzaga on LinkedIn (Bieta Naizaga) and Instagram (@bianca.bonzara) for updates on Binance events in Florianópolis and the region - [TBD]
- [ ] Follow Binance Brazil (@binancebrasil) for event announcements, competitions, and community opportunities - [TBD]
- [ ] Explore **CZ’s Easy Labs incubator** (open full-time application form) and **BNB Chain** for project submission and funding opportunities - [TBD]
- [ ] Contact Bianca Gonzaga directly for information on Binance acceleration programs (remote, 8-hour workday, global team) — particularly relevant for marketing professionals - [TBD]

- [ ] Read *Dynamics of Wealth* (recommended by Hamilton Haskell) to identify personal strengths before choosing a professional specialization - [TBD]
- [ ] Connect with Hamilton Haskell on LinkedIn for further discussion on the Chainless model and DeFi neo-banking - [TBD]
- [ ] Contact Kais Al-Tabbaa on LinkedIn or Instagram if interested in exploring market opportunities or for business development discussions - [TBD]

**@Kais Al-Tabbaa (Elibank)**

- [ ] Hire a social media manager (Instagram, TikTok, marketing) for Elibank — open to remote candidates; interested parties should send a CV directly - [TBD]
